

**The API to search, scrape, and
interact with the web at scale.**

Firecrawl turns any website into clean, LLM-ready data — Markdown, structured JSON, screenshots, and more — with a single API call. It's built for AI agents, RAG pipelines, and data pipelines that need reliable access to the live web without wrestling with proxies, JavaScript rendering, or rate limits.

[Website](#) · [Docs](#) · [API Reference](#)

Why Firecrawl

- **High reliability** — handles the vast majority of real-world pages, including JavaScript-heavy sites, without manual proxy configuration.
- **Fast** — optimized for real-time agent workflows and dynamic applications.
- **LLM-ready output** — clean Markdown, structured JSON (with schema-based extraction), screenshots, and HTML.
- **Zero infrastructure overhead** — rotating proxies, orchestration, retries, and rate limiting are handled for you.
- **Agent-ready** — plug into any AI agent or MCP-compatible client

(Claude, Cursor, and others) in a single step.

- **Open source** — self-host it or use the hosted API service.

Core Capabilities

Feature	What it does
Scrape	Extract content from a single URL as Markdown, structured JSON, HTML, or a screenshot.
Crawl	Recursively traverse a site and return clean content for every discovered page.

Feature	What it does
Map	Quickly enumerate all URLs on a site without scraping full content.
Search	Run web searches and optionally scrape the results in one call.
Extract	Pull structured data out of one or many pages using a schema.
Interact	Click, navigate, and operate pages programmatically, then extract the result.

Quickstart

Get an API key by signing up at firecrawl.dev, or run Firecrawl yourself using the self-hosted setup in the docs.

Python

```
pip install firecrawl-py
```

```
from firecrawl import  
Firecrawl  
  
app = Firecrawl(api_key="fc-  
YOUR_API_KEY")  
result =  
app.scrape("https://example.  
com")  
print(result.markdown)
```

Node / TypeScript

```
npm install firecrawl
```

```
import { Firecrawl } from  
'firecrawl';  
  
const app = new Firecrawl({  
  apiKey: 'fc-YOUR_API_KEY'  
});  
const result = await  
app.scrape('https://example.  
com');  
console.log(result.markdown)  
;
```

cURL

```
curl -X POST  
'https://api.firecrawl.dev/v  
2/scrape' \  
  -H 'Authorization: Bearer  
fc-YOUR_API_KEY' \  

```

```
-H 'Content-Type:  
application/json' \  
-d '{ "url":  
"https://example.com" }'
```

Structured Extraction

Define a schema and get typed,
structured JSON back instead of
raw text:

```
from firecrawl import  
Firecrawl  
from pydantic import  
BaseModel  
  
class Article(BaseModel):  
    title: str  
    author: str  
    published_date: str  
  
app = Firecrawl(api_key="fc-
```

```
YOUR_API_KEY")
result =
app.scrape("https://example.
com/blog/post", formats=
[{"type": "json", "schema":
Article}])
print(result.json)
```

Crawling a Site

```
crawl_result = app.crawl(
    "https://example.com",
    limit=100,
    scrape_options=
{"formats": ["markdown"]}
)

for page in
crawl_result.data:
```

```
print(page.metadata.source_url)
```

MCP Server

Connect Firecrawl directly to Claude, Cursor, or any MCP-compatible client:

```
npx firecrawl-mcp
```

See [firecrawl-mcp-server](#) for full setup instructions and available tools (scrape, crawl, search, map, extract, parse).

SDKs

- [Python](#)
- [Node / TypeScript](#)

- [Go](#)
- [Rust](#)

Self-Hosting

Firecrawl is open source and can be run on your own infrastructure. See the [self-hosting_guide](#) for Docker Compose setup and configuration options.

Contributing

Contributions are welcome. Please open an issue to discuss significant changes before submitting a pull request. See `CONTRIBUTING.md` for development setup and guidelines.

License

Firecrawl's core API and SDKs are released under the GNU Affero General Public License v3.0 (AGPL-3.0). See `LICENSE` for details.
